

Six for Six - Milestone 5

Team Number: 101-6

Calista Nguyen, Evan Easton, Joe Falbo, Nico Barone, Michael Heine, Ben Wedeen

Test 1: Make sure that the recipe cards work on our home page

- Checks to see if a user wants a different recipe, the recipe card will change to a different recipe.
- When a user goes through the cards, they are able to weed out the ones they do not like and add the recipe from the card to their inventory to the recipes that they do like.
- When viewing their inventory, the user can look at the recipes they added and choose whether to view the full recipe or remove the recipe from their inventory.
- If the user is not logged in, make a pop-up window that prevents the user from adding anything to their inventory.

Test 2: Search/Filter returns proper results

- When the user searches for a recipe, the search results show all the recipes that are similar to what the user put into the search bar
- From the results, the user can view the recipe and/or add it to their inventory
- If the user applies a filter to the cards, the cards should only display recipes based on the filter applied

Test 3: Login function works properly

- Within the login page, have a user create an account with a username and password and be able to create an account with the credentials of their choosing
 - We will make sure that the passwords must meet a certain requirement before being able to be created
- Once the user has created an account, they should be able to log out of their account and then log back in using the credentials that they made.
 - Logging out should send the user back to the home screen and not allow them to add new recipes
 - There should be no problem created by logging out and back in
- The user should be able to log out of one account and switch to a new account and have the new accounts data instead
- The recipes that the user has saved should stay saved even if the user logs out and back in
